DETAILED ACTION

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. Claims 1-3 are rejected under 35 U.S.C. 102(b) as being anticipated by LaPerre (U.S. 5,620,775).

The reference teaches glass beads and shards made from heated recycled ground glass affixed by an adhesive layer and or adhesive/fabric layer to a substrate (abstract, col. 9, lines 40-60, col. 15, lines 45-65). The instant claimed process limitation of mixing with carbon is given little weight in this rejection as it is unclear how it makes a different glass particle product.

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the

differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 1-3 are rejected under 35 U.S.C. 103(a) as being unpatentable over LaPerre (U.S. 5,620,775) in view of Taylor et al. (U.S. 2,461,011).

LaPerre teaches recycled heated glass particles on a substrate as noted above. Taylor teaches coating glass particles with carbon during thermal processing to prevent them from forming lumps (col. 1, lines 25-35). The instant invention claims the use of heat treated glass particles that have been coated with carbon on a substrate. It would have been obvious to one of ordinary skill in the art to have coated the particles of LaPerre with carbon during heating to prevent lumping because of the teachings of Taylor. Weight is given to the process limitation of carbon coating in this rejection.
